

Project Title: Extending the Lifetime of Organic Solar Cells

No: 165

Supervisor: Professor Paul Dastoor

I am currently a second year IT student, majoring in software development. For the past 3 months I have been involved in the Centre for Organic Electronics (COE) Grand Challenge, a research project that aimed to develop a new technological device powered by solar energy. I have been highly interested in Organic Solar Cells as they are a relatively new advancement and have the potential to lead a new market and replace fuel and coal based production. My future goals include contributing to OPV research, and expanding my research experience for a post-graduate degree.
